

TRINAMIX AI Engineer

Entry Level | Campus Hire | 0 – 1 Year Experience

 **Location:** Pune / Hybrid

 **Type:** Full-Time

 **Degree:** B.E. / B.Tech /
M.Tech / M.Sc

ABOUT TRINAMIX

Trinamix is a US-based enterprise technology company operating at the intersection of AI, supply chain, enterprise systems, and decision intelligence.

For over a decade, we have helped global enterprises transform complex operational ecosystems across procurement, manufacturing, logistics, planning, finance, and customer operations. Today, we are extending that foundation into next-generation enterprise AI at scale.

Our teams are building production-grade AI systems using GenAI, LLMs, agentic frameworks, retrieval architectures, and enterprise data platforms to solve high-impact business problems at scale.

Unlike consumer AI applications, enterprise AI requires deep integration with operational workflows, transactional systems, governance layers, and real-time decision-making environments. This is the engineering frontier where Trinamix operates.

The future of AI will not only be built in research labs — it will also be built inside the operational backbone of global enterprises.

ROLE OVERVIEW

As an entry-level AI Engineer at Trinamix, you will join a high-growth team and be mentored by senior engineers working on production enterprise AI systems. You will be given real ownership quickly, contribute to meaningful products, and grow into a full AI engineer role within 12–18 months.

This role is ideal for graduates from top engineering institutions who are passionate about AI, curious about difficult systems-level problems, and eager to build real-world impact — not just academic experiments.

WHY TOP ENGINEERS JOIN TRINAMIX

At Trinamix, engineers are not isolated into narrow implementation roles. You will work on real AI systems that operate in enterprise production environments and directly influence business operations at enterprise AI scale.

We provide a rare opportunity to work simultaneously across:

- Large-scale GenAI and agentic AI systems deployed in production
- Enterprise-grade architectures involving data platforms, APIs, workflows, and automation
- Real-world challenges in LLM orchestration, reasoning, retrieval, governance, latency, and scale
- Cross-functional collaboration with domain experts, architects, and global enterprise clients
- Intelligent automation and autonomous decision-support systems
- Supply chain and operational decision intelligence
- Rapid ownership and technical growth in a high-impact environment

Unlike traditional entry-level roles where engineers spend years on narrow tasks, Trinamix provides accelerated exposure across the full AI engineering lifecycle — from experimentation to deployment.

We are building engineers who can architect the future of enterprise AI, not just consume AI APIs.

Our engineers work on technically difficult problems — including:

- LLM orchestration and multi-step reasoning
- Retrieval-Augmented Generation (RAG) at enterprise scale
- Multi-agent systems with memory and tool use
- Enterprise knowledge systems and vector search
- AI governance, observability, and responsible AI in production
- Real-time operational intelligence and workflow automation

At Trinamix, growth is accelerated through ownership. Engineers are encouraged to contribute across architecture, experimentation, deployment, and product thinking — not just isolated coding tasks.

This environment is designed for individuals who want to become builders of enterprise AI platforms and systems — not simply consumers of AI APIs.

WHAT YOU WILL DO

- Learn and apply GenAI concepts — LLMs, RAG pipelines, prompt engineering — under structured mentorship
- Assist in building and testing AI prototypes and evolve them toward production-ready systems
- Work with structured and unstructured enterprise data for real AI use cases
- Help implement vector search, embeddings, and retrieval systems
- Write Python scripts and data pipelines to process, clean, and transform enterprise data
- Explore and experiment with open-source AI frameworks (LangChain, HuggingFace, LlamaIndex, etc.)
- Integrate AI components with APIs, internal tools, and enterprise applications
- Document experiments, findings, and design decisions with clarity
- Collaborate with senior engineers and domain experts on assigned modules
- Participate in architecture discussions, code reviews, and team knowledge-sharing

WHAT WE ARE LOOKING FOR

♦ Strong Python fundamentals	♦ Understanding of REST APIs
♦ Basic ML / Deep Learning concepts	♦ Systems thinking and problem-solving mindset
♦ Familiarity with NumPy, Pandas, Scikit-learn	♦ Strong written communication skills
♦ Exposure to PyTorch or TensorFlow	♦ Ownership mindset and bias for action
♦ Curiosity about LLMs and GenAI	♦ Collaborative and team-oriented attitude

GOOD TO HAVE

- Academic projects or internships involving ML / NLP / AI systems
- Hands-on experience with Hugging Face models, LangChain, or OpenAI API
- Exposure to cloud platforms (AWS, GCP, Azure) — even through personal projects
- Kaggle competitions, open-source contributions, or research publications
- Basic familiarity with SQL, vector databases, or data engineering concepts

WHAT YOU WILL GAIN

At Trinamix, freshers are not treated as interns. You will own tasks, contribute to real products, and be accelerated into a full AI engineer role within 12–18 months. You will work alongside experienced engineers, gain exposure to enterprise AI at scale from Day 1, and be part of a team building the future of intelligent enterprise operations.

- Clear 12-month growth roadmap to Senior AI Engineer with defined milestones
- Access to premium AI tools, cloud credits, and continuous learning resources
- Collaborative, innovation-driven culture where ownership and systems thinking are rewarded over narrow task execution

WHY TRINAMIX

Trinamix combines the pace and ambition of a high-growth AI organization with the depth and scale of global enterprise environments. Here, freshers are not treated as interns — you own tasks, contribute to real products, and are accelerated into a full AI engineer role.

What makes Trinamix different for early-career engineers:

- Structured onboarding and mentorship from senior AI engineers from Day 1
- Exposure to production enterprise AI systems
- Clear 12-month growth roadmap to Senior AI Engineer
- High ownership from early stages — systems thinking is rewarded over task execution
- Direct interaction with architects, domain experts, and global stakeholders
- Access to cutting-edge AI tooling, platforms, and cloud credits
- Fast technical growth in a collaborative, outcome-driven engineering culture

WHY TRINAMIX IS INVESTING HEAVILY IN AI

The next wave of AI transformation will occur inside enterprises — where large-scale operational systems, workflows, and decision-making processes generate enormous volumes of data and complexity.

Most enterprises today already possess:

- Massive transactional systems and complex operational workflows
- Distributed enterprise data across supply chain, finance, and procurement
- Deep institutional process knowledge accumulated over decades
- ERP ecosystems, APIs, and integration layers that were never designed to reason intelligently.

At Trinamix, we are building AI systems that integrate deeply into enterprise operations — enabling intelligent workflows, autonomous assistance, decision augmentation, and operational optimization.

Our investments span:

- Enterprise AI agents embedded into real operational workflows
- AI-powered workflow orchestration and intelligent automation
- Retrieval and reasoning systems operating over enterprise data
- Decision intelligence platforms and autonomous decision-support
- Intelligent document and transaction processing
- AI accelerators for enterprise operations
- Multi-platform enterprise data intelligence

Because of our deep expertise in enterprise transformation and supply chain ecosystems, we are uniquely positioned to bridge AI innovation with real operational impact — combining the engineering ambition of an AI-native company with the domain depth of a seasoned enterprise technology firm.

This is not experimental AI for demonstrations. This is enterprise AI designed for production, scale, governance, and measurable business outcomes.

HOW TO APPLY

Eligible graduates from Jadavpur University are encouraged to apply through their Placement Cell. Shortlisted candidates will be invited for a technical assessment followed by a structured interview process.
